

Physioworld are pleased to announce the launch of their new website

[www.physioworld.net](http://www.physioworld.net)

There is a growing demand to reduce current levels of sickness-related work absence and incapacity benefit claims. These are most commonly caused by musculoskeletal conditions and disorders such as stress, many of which are exacerbated by staying off work.

Physiotherapists have a central role to play in helping people to return to work and to manage their own health going forward. The focus on improving the health of the working population comes at a time when 'lifestyle conditions' such as musculoskeletal disorders are on the rise.

These health problems account for around two-thirds of long-term sickness absence and incapacity benefit claims. Physiotherapists, along with other allied health professionals, can play a central role in helping people to prevent these conditions from developing, or to adopt strategies to self-manage them effectively.

Physioworld produce results in timescales which provide a highly cost effective solution for employees, employers and their insurers. This has proven to significantly reduce staff absenteeism within the corporate market.

*On average we perform one assessment and 2.6 treatments per patient.*

*We review the referral and aim to contact the patient within 48 hours.*

*The average time from us receiving the referral to the patient being seen is 7 days.*

*On a recent satisfaction survey 97% said they would recommend the services to others, 76% found the treatment very beneficial.*
